Ex. No: 1	Network Commands
22/12/2022	

Aim :

To use commands like

- tcpdump
- netstat
- ifconfig
- nslookup
- traceroute

Commands:
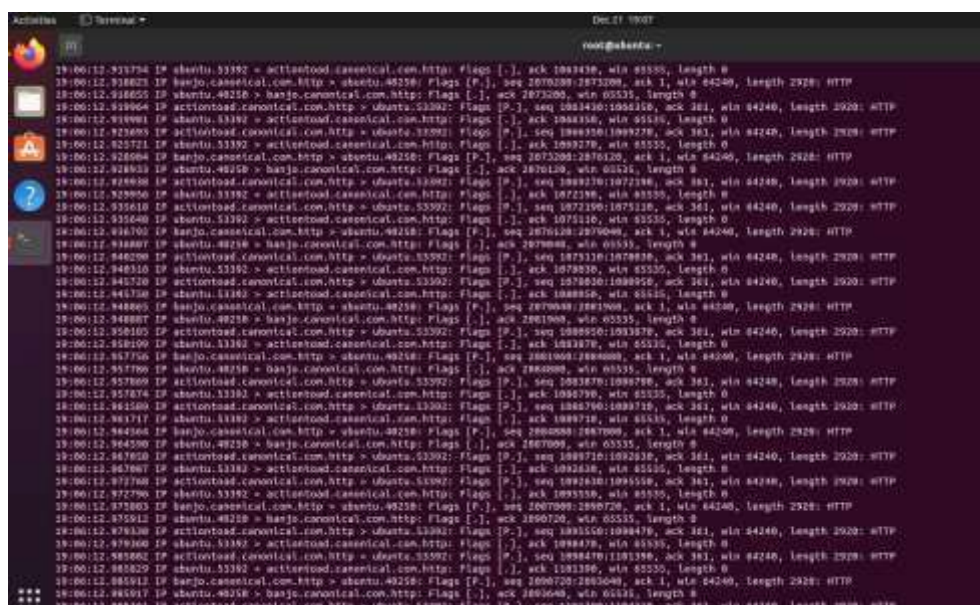

1.tcpdump:

Flags :-

Tcpdump -D

```
root@ubuntu:~# which tcpdump
/usr/sbin/tcpdump
root@ubuntu:~# tcpdump -D
1.ens33 [Up, Running]
2.lo [Up, Running, Loopback]
3.any (Pseudo-device that captures on all interfaces) [Up, Running]
4.bluetooth-monitor (Bluetooth Linux Monitor) [none]
5.nflog (Linux netfilter log (NFLOG) interface) [none]
6.nfqueue (Linux netfilter queue (NFQUEUE) interface) [none]
```

Tcpdump -I any;

Tcpdump -A—ASCII dump of all packets

Tcpdump- d Dumps packet contents in human readable

form tcpdump-dd Dumps in to C Format tcpdump-ddd

Tcpdump – I ens33 listening to a particular wireless interface

2.Netstat

Netstat -I – list all Interface   available ;

```
Kernel Interface table
Iface      MTU    RX-OK RX-ERR RX-DRP RX-OVR    TX-OK TX-ERR TX-DRP TX-OVR Flg
ens33     1500   626184      0      0 0       104903      0      0      0 BMRU
lo       65536     1218      0      0 0         1218      0      0      0 LRU
```

Netstat :

   Display network statistics

```
root@ubuntu:~# netstat
Active Internet connections (w/o servers)
Proto Recv-Q Send-Q Local Address           Foreign Address         State

  2   *  *  *
  3   *  *  *
  4   *  *
```

Result :

      Thus the given commands were executed and their output Observed

Ex. No: 2	
29/12/2022	**Download Webpage Using TCP Sockets**

Aim:

    Write a HTTP web client program to download a web page using TCP sockets.

Algorithm:

    1.Create URL Object and pass URL as string to constructor .

    2.Use .openStream() and use .readAllBytes() and to the byte array.

    3.Using FileOutputStream create another object and write the byte array.

    4.Close the stream.

    5.Catch all Exceptions If any may occour.

Program:

```
package Exercise2;

import java.net.URL;

import java.io.*;
public class downloadpage {

    public static void main(String []args) {
        try {
            URL page=new URL("https://www.snuchennai.edu.in/");
            System.out.println("Port : "+page.getDefaultPort());
            System.out.println("Host : "  +page.getHost());
            System.out.println("Protocol: "+page.getProtocol());
            byte []arr=page.openStream().readAllBytes();
            String out=new String(arr);
            System.out.println(out);
            FileOutputStream out1=new
FileOutputStream("webdownload.html");
            out1.write(arr);
            out1.close();
        }catch(Exception e) {
            e.printStackTrace();
        }

    }
}
```

Sample Input:

        Webdownload.html and snuchennai.edu.in

Sample Output:

```
var ekit_config = {"ajaxurl":"https:\/\/www.snuchennai.edu.in\/wp-admin\/admin-ajax.php","nonce":"964133699c"};
</script>
<script src='https://www.snuchennai.edu.in/wp-content/plugins/elementskit-lite/widgets/init/assets/js/elementor.js?ver=2.7.0' id='elements
<script src='https://www.snuchennai.edu.in/wp-content/plugins/elementor/assets/js/preloaded-modules.min.js?ver=3.7.7' id='preloaded-module
<script id='wp-util-js-extra'>
var _wpUtilSettings = {"ajax":{"url":"\/wp-admin\/admin-ajax.php"}};
</script>
<script src='https://www.snuchennai.edu.in/wp-includes/js/wp-util.min.js?ver=5.8.4' id='wp-util-js'></script>
<script id='wpforms-elementor-js-extra'>
var wpformsElementorVars = {"captcha_provider":"recaptcha","recaptcha_type":"v2"};
</script>
<script src='https://www.snuchennai.edu.in/wp-content/plugins/wpforms-lite/assets/js/integrations/elementor/frontend.min.js?ver=1.7.7.2' i
                <script>
                /(trident|msie)/i.test(navigator.userAgent)&&document.getElementById&&window.addEventListener&&window.addEventList
                </script>
                        </body>
</html>
```

Result:

Thus Using the script in java the required webpage was downloaded.

Ex. No: 3.1	Sockets Programming Using Java
05/01/2023	

AIM:

To write a socket program for implementation of echo

Algorithm:

CLIENT :

1. Start the program.

2. Create a socket which binds the Ip address of server and the port address to acquire service.

3. After establishing connection send a data to server.

4. Receive and print the same data from server.

5. Close the socket.

6. End the program

SERVER

1. Start the program.

2. Create a server socket to activate the port address.

3. Create a socket for the server socket which accepts the connection.

4. After establishing connection receive the data from client.

5. Print and send the same data to client.

6. Close the socket.

7. End the program.

Code:

EchoClient.java

```java
package Exercise3;
import java.net.*;
import java.io.*;
public class EchoClient {
public static void main(String [] args) {
        Socket s1;
        BufferedReader r1,r2;
        PrintStream p1;
        String op="";
        try {
                s1=new Socket(InetAddress.getLocalHost(),8080);
```

```
            r1=new BufferedReader(new InputStreamReader(System.in));

            r2=new BufferedReader(new InputStreamReader(s1.getInputStream()));

            p1=new PrintStream(s1.getOutputStream());
            while(!op.equals("end")) {
                    System.out.print("\nClient :");
                    op=r1.readLine();
                    p1.println(op);
                    System.out.print("\nServer:"+r2.readLine());

            }
        } catch (Exception e) {

                e.printStackTrace();
        }

}
}
```

EchoServer.java

```java
package Exercise3;

import java.io.BufferedReader;
import java.io.InputStreamReader;
import java.io.PrintStream;
import java.net.ServerSocket;
import java.net.Socket;

public class EchoServer {
public static void main(String[] args) {
        String op1="";
        Socket s1;
        ServerSocket serv;
        BufferedReader r2;
        PrintStream p1;
        try {
                serv=new ServerSocket(8080);
                s1=serv.accept();
                r2=new BufferedReader(new InputStreamReader(s1.getInputStream()));
                p1=new PrintStream(s1.getOutputStream());
                while(!op1.equals("end")) {
                        op1=r2.readLine();
                        System.out.println("Message Recieved and sentback");
                        p1.println(op1);
                }
        }catch(Exception e) {
                e.printStackTrace();
        }
}
}
```

OUTPUT:

Result: Thus the echo server and client was implemented using java sockets library.

Ex. No: 3.2	
05/01/2023	**Download Webpage Using TCP Sockets**

AIM: To write a client-server application for chat using TCP

Algorithm :

CLIENT:

1. Start the program

2. Include necessary package in java

3. To create a socket in client to server.

4. The client establishes a connection to the server.

5. The client accept the connection and to send the data from client to server.

6. The client communicates the server to send the end of the message 7. Stop

the program.

Server:

1. Start the program

2. Include necessary package in java

3. To create a socket in server to client

4. The server establishes a connection to the client.

5. The server accept the connection and to send the data from server to client

and 6. vice versa

7. The server communicate the client to send the end of the message.

8. Stop the program.

Code:

TCPClient.java

```
package Exercise3;

import java.io.BufferedReader;
import java.io.InputStreamReader;
import java.io.PrintStream;
import java.net.InetAddress;
import java.net.Socket;

public class TCPClient {
```

```java
    public static void main(String [] args) {
            Socket s1;
            BufferedReader r1,r2;
            PrintStream p1;
            String op="";
            try {
                    s1=new Socket(InetAddress.getLocalHost(),8080);
                    r1=new BufferedReader(new InputStreamReader(System.in));
                    r2=new BufferedReader(new
InputStreamReader(s1.getInputStream()));
                    p1=new PrintStream(s1.getOutputStream());
                    while(!op.equals("end")) {
                            System.out.print("Client :");
                            op=r1.readLine();
                            p1.println(op);
                            System.out.println("Server: "+r2.readLine());

                    }
            }  catch (Exception e) {

                    e.printStackTrace();
            }
        }
}
```
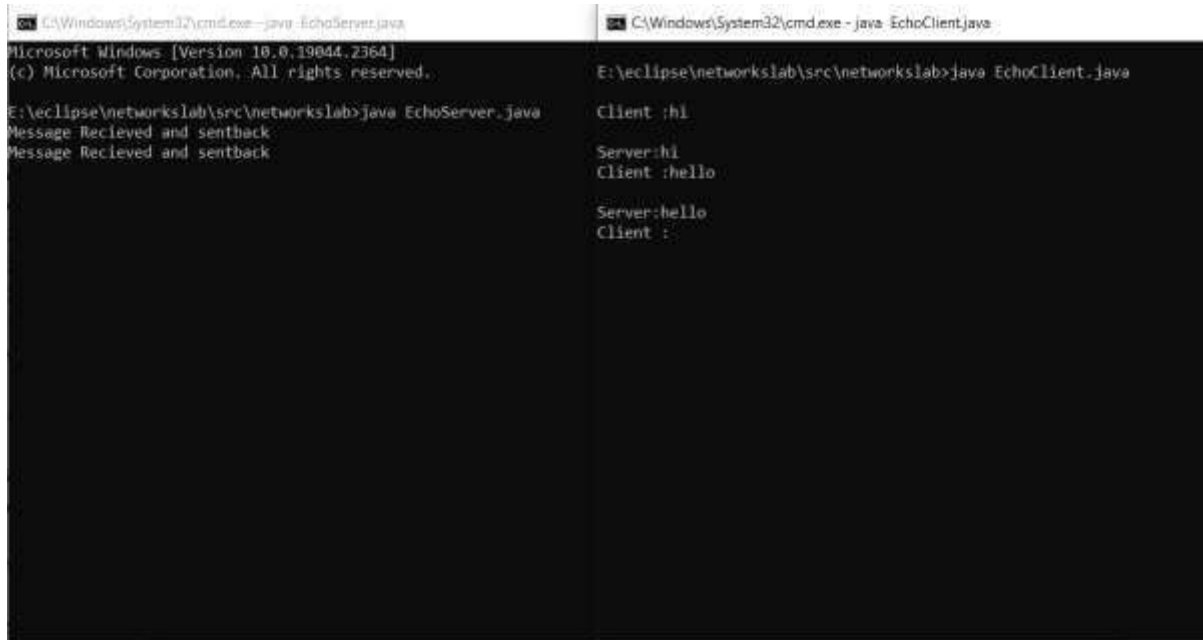

TCPServer.java
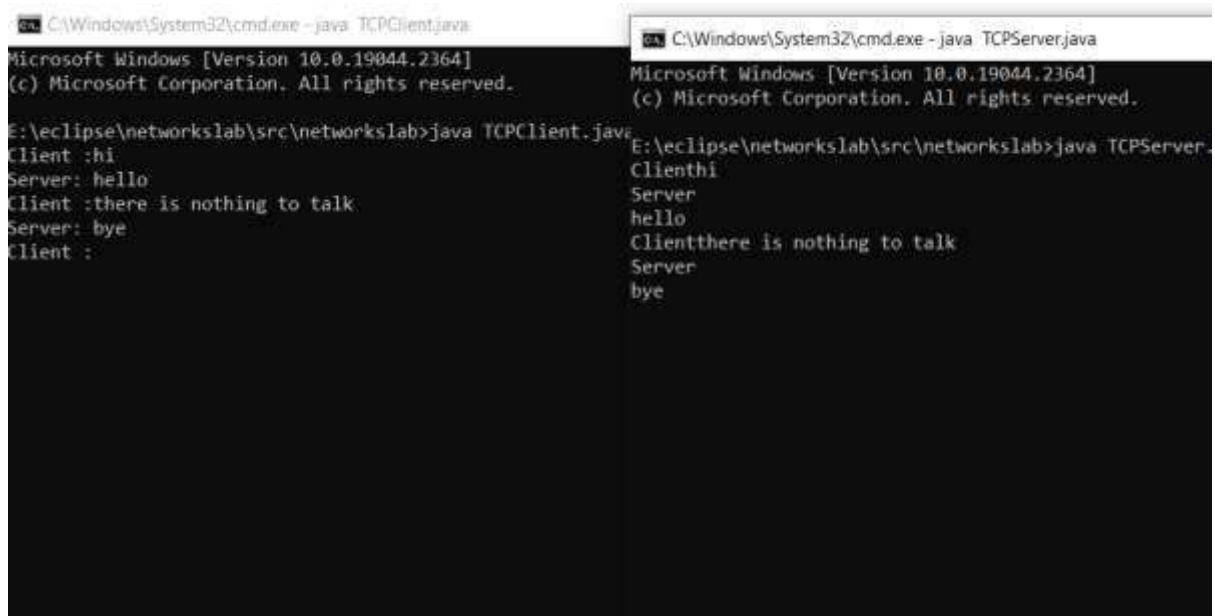

```java
package Exercise3;

import java.io.BufferedReader;
import java.io.InputStreamReader;
import java.io.PrintStream;
import java.net.ServerSocket;
import java.net.Socket;

public class TCPServer {
      public static void main(String[]args) {
            String op1="";
            Socket s1;
            ServerSocket serv;
            BufferedReader r2,r1;
            PrintStream p1;
            try {
                    serv=new ServerSocket(8080);
                    s1=serv.accept();
                    r1=new BufferedReader(new InputStreamReader(System.in));
                    r2=new BufferedReader(new
InputStreamReader(s1.getInputStream()));
                    p1=new PrintStream(s1.getOutputStream());
                    while(!op1.equals("end")) {
                            System.out.println("Client"+r2.readLine());
                            System.out.println("Server");
                            op1=r1.readLine();

                            p1.println(op1);
                    }
            }catch(Exception e) {
                    e.printStackTrace();
```

```
            }
        }
}
```

OUTPUT   :

Result:

Thus a simple chat server client setup was initiated using TCP Protocol using java sockets..

Ex. No: 3.3	
05/01/2023	**Download Webpage Using TCP Sockets**

AIM:

To Perform File Transfer in Client & Server Using TCP/IP

Algorithm :

CLIENT :

1. Start.

2. Establish a connection between the Client and Server.

3. Socket ss=new Socket(InetAddress.getLocalHost(),1100);

4. Implement a client that can send two requests.

i) To get a file from the server.

ii) To put or send a file to the server.

5. After getting approval from the server ,the client either get file from the server or send

6. file to the server

SERVER:

1. Start.

2. Implement a server socket that listens to a particular port number. 3. Server

reads the filename and sends the data stored in the file for the'get' request.

4. It reads the data from the input stream and writes it to a file in theserver for

the 'put' instruction.

5. Exit upon client's request.

6. Stop.

Code :

FileClient.java

```
package networkslab;
import java.io.*;
import java.net.*;
import java.net.InetAddress;
public class FileClient {
static DataInputStream k;
     static DataOutputStream k1;
public static void main(String [] args) {
          try(Socket s=new Socket("localhost",8080)){
```

```
                k=new DataInputStream(s.getInputStream());
        k1=new DataOutputStream(s.getOutputStream());
        send("E:\\oslab\\oslabex1.pdf");
                k.close();                      k1.close();
            }catch(Exception e) {
                e.printStackTrace();
            }
        }
    }
    public static void send(String path) {
            int bytes=0;
            File f1=new File(path);
            try {
                FileInputStream is=new FileInputStream(f1);
                k1.writeLong(f1.length());
                byte[] bfr=new byte[4*1024];
                while((bytes=is.read(bfr))!=-1) {
                        k1.write(bfr,0,bytes);
                        k1.flush();
                }
                is.close();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }
}
```

FileServer.java

```
package Exercise3;
import java.io.*;
import java.net.*;

            }
        }
    public static void recv(String fname) {
            int bits=0;

            try {
                FileOutputStream f=new FileOutputStream(fname);
                long inr=in.readLong();
                byte [] buf=new byte[4*1024];
```

```
                    while(inr>0 && (bits=in.read(buf, 0,
(int)Math.min(inr,buf.length )))!=-1) {
                        f.write(buf,0,bits);
                        inr-=bits;

                    }
                    f.close();
            } catch (IOException e) {

                e.printStackTrace();
            }

        }
}
```
OUTPUT:
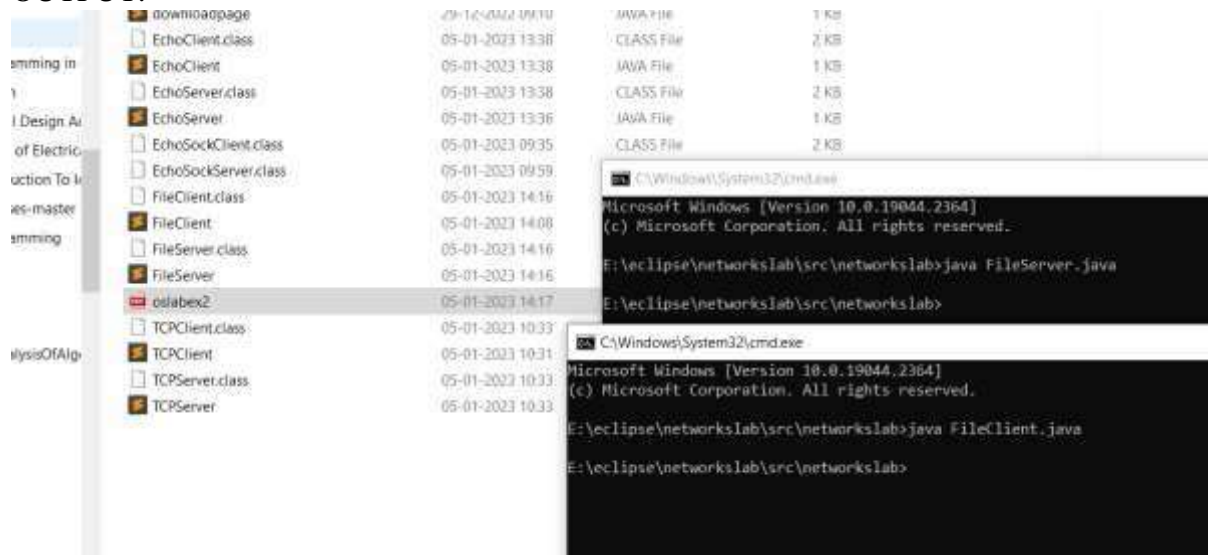

<u>***Result***</u>:

    Thus the File was sent by the client and received by the fileserver in the specified location.

Ex. No: 4	**Simulation Of DNS Using UDP Sockets**
12/01/2023	

Aim: To Simulate DNS using Datagram Packets.

Algorithm:

Server:

1. Run Process .exec command nslookup to get dns ip address from cmd

2. Create a datagram socket and bind it to a port 3. Create a datagram packet
   to receive client request

    4. Read the domain name from client to be resolved.

    5. Lookup the host array for the domain name

    6. If found then retrieve corresponding address

    7. Create a datagram packet and send ip address to client

    8. Repeat steps 3-7 to resolve further requests from clients

    9. Close the server socket

Client:

    1. Create a datagram socket

    2. Get domain name from user

    3. Create a datagram packet and send domain name to the server

    4. Create a datagram packet to receive server message

    5. Read server's response

    6. If ip address is found then display it else display "Domain does not
       exist"

    7. Close the client socket

Code:

```

Sample Input/Output:

Result:

Thus DNS was simulated using Datagram Packets in java

Ex. No: 5	
19/01/2023	**Simulation Of ARP and RARP Protocols**

Aim:

To simulate ARP and RARP Protocols in java.

Algorithm:

ARP:

Server:

1. Start the program

2. Accept the socket which is created by the client.

3. Server maintains the table in which IP and corresponding MAC addresses are stored.

4. Read the IP address which is send by the client.

5. Map the IP address with its MAC address and return the MAC address to client.

Client:

1. Start the program

2. Using socket connection is established between client and server.

3. Get the IP address to be converted into MAC address.

4. Send this IP address to server.

5. Server returns the MAC address to client

RARP:

Server:

1. Start the program.

2. Server maintains the table in which IP and corresponding MAC addresses are stored.

3. Read the MAC address which is send by the client.

4. Map the IP address with its MAC address and return the IP address

to client

Client:

1.Start the program

2. using datagram sockets UDP function is established.

3.Get the MAC address to be converted into IP address.

4.Send this MAC address to server.

5.Server returns the IP address to client

Code:

Result:

Thus The ARP and RARP protocols were simulated in java.

Ex. No: 6	**Simple Network Topology Creation using NS2**
02/02/2023	

Aim:

To create simple topology using Network Simulator

Algorithm:

     Step 1: Start network simulator OTCL editor.

Step 2: Create new simulator using set ns [new Simulator] syntax

Step 3: Create Trace route to Network Animator set nf [open out.nam w] $ns namtrace-all $nf

     Step 4: Create procedure to trace all path

Step 5: Create full/simplex connection

     Step 6: Connect TCP with null command/udp

     Step7:visualise the same in nam

Code:

```
set ns [new Simulator]
set f [open outEx1.tr w]
set nf [open outEx1.nam w]
$ns namtrace-all $nf
$ns trace-all $f

proc finish {} {

    global ns nf f
    $ns flush-trace
    puts " completed"
    close $nf
    close $f
```

```
    exit 0
}

set n0 [$ns node]
    puts "n0: [$n0 id]"
set n1 [$ns node]
    puts "n1: [$n1 id]"
set n2 [$ns node]
    puts "n2: [$n2 id]"
set n3 [$ns node]
    puts "n3: [$n3 id]"
set n4 [$ns node]
    puts "n4: [$n4 id]"

$ns duplex-link $n0 $n2 100Mb 5ms DropTail
$ns duplex-link $n2 $n4 54Mb 10ms DropTail
$ns duplex-link $n1 $n2 100Mb 5ms DropTail
$ns duplex-link $n2 $n3 54Mb 10ms DropTail
$ns queue-limit $n2 $n3 40
$ns simplex-link $n3 $n4 10Mb 15ms DropTail
$ns simplex-link $n4 $n3 10Mb 15ms DropTail

set tcp0 [new Agent/TCP]
$ns attach-agent $n1 $tcp0

set udp1 [new Agent/UDP]
$udp1 set dst_addr_ Unicast
$udp1 set fid_ 1
$ns attach-agent $n0 $udp1

set null0 [new Agent/Null]
$ns attach-agent $n3 $null0
```

```
set sink0 [new Agent/TCPSink]

$ns attach-agent $n4 $sink0

set ftp0 [new Application/FTP]

$ftp0 attach-agent $tcp0

set cbr0 [new Application/Traffic/CBR]

$cbr0 set rate_ 2Mb

$cbr0 set packetSize_ 1000

$cbr0 attach-agent $udp1

$ns connect $udp1 $null0

$udp1 set fid_ 0

$ns connect $tcp0 $null0

$tcp0 set fid_ 1

$ns at 0.05 "$ftp0 start"

$ns at 0.1 "$cbr0 start"

$ns at 60.0 "$ftp0 stop"

$ns at 60.5 "$cbr0 stop"

$ns at 61.0 "finish"

$ns run
```

Output:
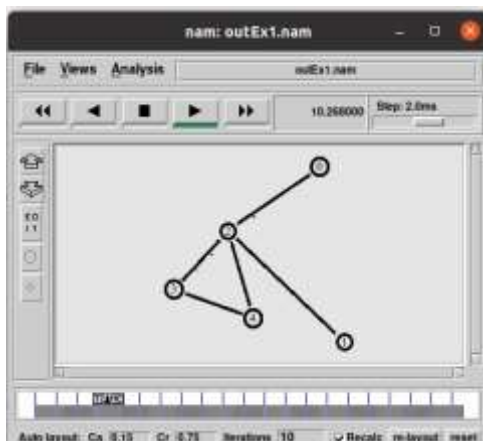

My Understanding:

 We write out the physical node and define the connection by duplex/simplex and we set up udp/tcp connections for the nodes whose types may vary .When we run ns x.tcl this generate a nam and a trace file which can be further processed in anyother programming language,here we use NAM to visualise the connections and packet delivery between nodes.

Result:

  Thus a simple network topology was created and visualised using nam and network simulator

Ex. No: 6.1	
16/02/2023	**Simulation Of Congestion Control Algorithms in NS2**

Aim:

To Simulate Congestion Control using Network Simulator

Algorithm:

The size of the sender window is determined by the following two

factors

1. Receiver   window

size

2. Congestion window

size

1.Reciever Window Size:

Sender should not send data greater than receiver window size. • Otherwise, it leads to dropping the TCP segments which causes TCP Retransmission. • So, sender should always send data less than or equal to receiver window size. • Receiver dictates its window size to the sender through TCP Header

2.Congestion Window Size:

Sender should not send data greater than congestion window size. • Otherwise, it leads to dropping the TCP segments which causes TCP retransmission. • So, sender should always send data less than or equal to congestion window size. • Different variants of TCP use different approaches to calculate the size of congestion window. • Congestion window is known only to the sender and is not sent over the links.

Code:

```
    set ns [new Simulator]
set f [open congestion.tr w]
$ns trace-all $f

        Thus The TCP Congestion was simulated using ns2

Ex. No: 7	
23/02/2023	**Simulation Of Error Correction Code**

Aim:

To write a Java program to simulate Error Correction Code (CRC) in Java

Algorithm:

1.Define a function that does bit to bit Xor operation .Concatenate the bits into one Single String

2.Define another function to Divide the Polynomial with the CRC Polynomial and Obtain the Remainder using repeated Division .Ignore the leading zeros while division.

3.Take a Transmission String and CRC Polynomial. Divide and obtain CRC Remainder

4.Pad the CRC Remainder to the Transmission String and Again Divide Using CRC Polynomial If no Error the is Transmitted properly Function returns True

5.Introduce another Error to Transmission String and Divide Using CRC Polynomial .This time the isTransmittedProperly Function should return false

Code:

 CRC.java:

```java
package Exercise7;

public class CRC {
public  String Xor(String s1,String s2) {
        String res="";
        for(int i=0;i<s2.length();i++) {
            if(s1.charAt(i)==s2.charAt(i)) {
                res+='0';
            }
            else {
                res+='1';
            }
        }
        return res;
    }
public String  padBit(String s1,String s2) {
        int d2=s2.length();
```

```java
        for (int i=0;i<d2-1;i++) {

                s1+='0';

        }

        return s1;

    }

public String Divide(String s1,String s2) {

        int d1=s1.length();

        String tmp="";

        int track=0;

        String tmp2="";

        tmp=Xor(s1.substring(0, s2.length()),s2);

        track+=tmp.length();

        while(track<d1) {

                    if(tmp.charAt(0)=='0') {

                            tmp=tmp.substring(1);

                            tmp+=String.valueOf(s1.charAt(track++));

                    }

            tmp2=tmp;

            tmp="";

            tmp=Xor(tmp2,s2);

        }

        return tmp2;

    }
public boolean isTransmittedProperly(String originalBits,String CRCRemainder,String
divisor) {

        //String k=new CRC().Divide(padBit(originalBits,divisor), divisor);

        String s2=originalBits+CRCRemainder.substring(1);

        //System.out.println(new CRC().Divide(s2, divisor));

        if(new CRC().Divide(s2, divisor).equals("0000")) {
```

```
            return true;

        }

        return false;

    }

public static void main(String [] args) {

        String s1="10111011";

        System.out.println("No Error While Transmission: ");

        System.out.println(" Original BitArrangement:"+s1);

Ex. No: 9	**Simulation Of Distance Vector/Link State Routing Algorithm**
16/03/2023	

Aim:

To Implement Distance Vector And Link State Routing Algorithm in Java

Algorithm:

1.*Distance Vector Routing* :

1. Accept all nodes in the form of adjacency matrix

2. After accepting the nodes we run Bellman Ford Algorithm

3. Here we discover all nodes and update vector according to cost if less than existing

4. Mark unreachable nodes as inf

5. Traverse in lexicographic order

6. Repeat step 3

7. Change source nodes and run through same algorithm and print distance vector

8. Indices are the nodes

2.*Link State Routing Algorithm*:

1. Accept All Inputs as adjacency Matrix

2. After accepting the nodes we run Dijkstra Algorithm

3, Here also we discover the nodes and keep track of previous nodes in the form od   ArrayList in Java [Node no,isDiscovered,cost,Node Previous]

4. We run the loop until all IsDiscovered Subarray is 1

5.We cut the array into 4 part chunks as Subarray in java for easier use and manipulation of list entries

6.Inside the loop we check for minimum cost nodes and jump to that node and discover others while we keep track of existing node cost and update the subarray of neighbouring nodes iff the cost + adj[i][j]<existing cost.

7.We write another function to traceback the path to 0 or source node by jumping to the subarray.get[3]->pre node and print the path + cost

Code:

Distance VectorRouting.java

```java
package Exercise9;

import java.util.ArrayList;
import java.util.List;

class BellmanFord{
        int [][] adjmat;
        int source,len;
        int inf=45558;

     BellmanFord(int[][]adjmat,int arrlen,int source){
            this.adjmat=adjmat;
            this.source=source;
            len=arrlen;
     }
     List <Integer>vector=new ArrayList <Integer>(len);

      void initialize() {
            for(int i=0;i<len;i++) {

                      vector.add(adjmat[source][i]);
                }

     }
      void iterate() {
            initialize();
            int cur;
            int j=(source+1)%len;

             int [][] arr1=new int[len-1][len];
             int row=0;
                while(j!=source) {
                      cur=vector.get(j);
                      for(int k=0;k<len;k++) {
                            arr1[row][k]=adjmat[j][k];

                      }
                      row++;
                      if(row==len-1) {break;}

                      j++;
                      j=j%4;
                }

                      //System.out.println();

            j=(source+1)%len;
```

```java
                for(int i=0;i<len-1;i++) {
                        cur=vector.get(j);

                dijkstra s=new dijkstra(7,adjmat);
                s.set();
                //s.findmin(s.sl);
                s.run();

                s.print();
                for(int i=1;i<7;i++) {
                        System.out.println();
                        s.RouteConfigPrint(i);
                }
        }

        }
}
```
Output:

```
[0, 1, 0, null]
[1, 1, 2, 2]
[2, 1, 1, 0]
[3, 1, 1, 2]
[4, 0, 3, 2]
[5, 1, 2, 6]
[6, 1, 2, 3]

0-->1-->2=3
0-->2=1
0-->3-->2=2
0-->4-->2=4
0-->5-->6-->3-->2=6
0-->6-->3-->2=4
```

Result:

      Thus Distance Vector And Link State Routing Algorithms were studied and implemented in Java

Ex. No: 10	**Study of Performance of Routing Protocols Using ns2**
23/03/2023	

Aim:

To Simulate Routing Protocols like Distance Vector and Link State using ns2

Algorithm :

1.Create 4 nodes and make the necessary out.nam,out.tr files

2. After creating 4 nodes set node 2 as tcp node and node 3 as sink node

3. Set FTP to tcp agent using attach agent

4. set rtproto to Ls for link state / DV for Distance Vector

5.Analyse the performance by using the tools in the network animator

Code:

```
set ns [new Simulator]
$ns rtproto LS

set node1 [$ns node]
set node2 [$ns node]
set node3 [$ns node]
set node4 [$ns node]
set tf [open out.tr w]
$ns trace-all $tf
set nf [open out.nam w]
$ns namtrace-all $nf
proc finish {} {

global ns nf
$ns flush-trace
close $nf
exec nam out.nam &
exit 0

}
$node1 label "node1"
$node2 label "node1"
$node3 label "node1"
$ns duplex-link $node1 $node2 1.0Mb 10ms DropTail
$ns duplex-link $node2 $node3 1.0Mb 10ms DropTail
$ns duplex-link $node3 $node4 1.0Mb 10ms DropTail
$ns duplex-link $node4 $node1 1.0Mb 10ms DropTail
set tcp0 [new Agent/TCP]
$ns attach-agent $node1 $tcp0
set sink0 [new Agent/TCPSink]
$ns attach-agent $node4 $sink0
$ns connect $tcp0 $sink0

set traffic [new Application/FTP]
$traffic attach-agent $tcp0
$ns at 0.5 "$traffic start"
$ns rtmodel-at 1.0 down $node2 $node3
$ns rtmodel-at 2.0 up $node2 $node3
ns at 3.0 "$traffic start"
```
```
ns at 4.0 "$traffic stop"
ns at 5.0 "finish"
$ns run
```

Output:

Distance Vector

Link State Routing

Result:

Thus the Two routing protocols Link State and Distance Vector Routing were simulated and studied using ns2 and network animator
